## 1 Dijkstra's Algorithm

For the graph below, let $g(u, v)$ be the weight of the edge between any nodes $u$ and $v$. Let $h(u, v)$ be the value returned by the heuristic for any nodes $u$ and $v$.

| Edge weights | Heuristics |
| :---: | :---: |
| $g(A, B)=1$ | $h(A, G)=8$ |
| $g(B, C)=3$ | $h(B, G)=6$ |
| $g(C, F)=4$ | $h(C, G)=5$ |
| $g(C, G)=4$ | $h(F, G)=1$ |
| $g(F, G)=1$ | $h(D, G)=6$ |
| $g(A, D)=2$ | $h(E, G)=3$ |
| $g(D, E)=3$ |  |
| $g(E, G)=3$ |  |

Run Dijkstra's algorithm to find the shortest paths from $A$ to every other vertex. You may find it helpful to keep track of the priority queue and make a table of current distances.

$$
\begin{aligned}
& A \rightarrow B=1 \\
& A \rightarrow C=4 \\
& A \rightarrow D=2 \\
& A \rightarrow E=5 \\
& A \rightarrow F=6 \\
& A \rightarrow G=7
\end{aligned}
$$

1.2 Given the weights and heuristic values for the graph below, what path would A* search return, starting from $A$ and with $G$ as a goal?

A* would return $A-D-E-G$.
1.3 Is the heuristic admissible? Why or why not?

A heuristic is admissible if all of its estimations $h(x)$ are optimistic. No it's not, because the actual shortest path from $A \rightarrow G$ is of cost 7 if we take the northern route, but the heuristic estimates it will cost 8 .

## 2 Minimum Spanning Trees

Perform Prim's algorithm to find the minimum spanning tree. Pick $A$ as the initial node. Whenever there is more than one node with the same cost, process them in alphabetical order.

Use Kruskal's algorithm to find a minimum spanning tree.
In this case, Prim and Kruskal's output the same MST. This is not always the case.

2.3 There are quite a few MSTs here. How many can you find?

There are three choices to use an edge of weight 2 that can be used interchangeably and there are two choices of using an edge of weight 3 that can be used interchangeably. So there are $3 * 2=6$ possible MST's. This math does not always lead to this. The key thing to note is that we could replace one of the weight 2 edges with another weight 2 edge and the entire graph would be spanning. Same for the weight 2 edges.

## 3 Mechanical Sorting

3.1 Show the steps taken by each sort on the following unordered list:
$0,4,2,7,6,1,3,5$
(a) Insertion sort

| 0 | $\mid$ | 4 | 2 | 7 | 6 | 1 | 3 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 4 | 1 | 2 | 7 | 6 | 1 | 3 | 5 |
| 0 | 2 | 4 | 1 | 7 | 6 | 1 | 3 | 5 |
| 0 | 2 | 4 | 7 | 1 | 6 | 1 | 3 | 5 |
| 0 | 2 | 4 | 6 | 7 | 1 | 1 | 3 | 5 |
| 0 | 1 | 2 | 4 | 6 | 7 | 1 | 3 | 5 |
| 0 | 1 | 2 | 3 | 4 | 6 | 7 | 1 | 5 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 1 |

(b) Selection sort

| 0 | $\mid$ | 4 | 2 | 7 | 6 | 1 | 3 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 1 | 1 | 2 | 7 | 6 | 4 | 3 | 5 |
| 0 | 1 | 2 | 1 | 7 | 6 | 4 | 3 | 5 |
| 0 | 1 | 2 | 3 | 1 | 6 | 4 | 7 | 5 |
| 0 | 1 | 2 | 3 | 4 | 1 | 6 | 7 | 5 |
| 0 | 1 | 2 | 3 | 4 | 5 | 1 | 7 | 6 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 1 | 7 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 1 |

(c) Merge sort

| 04276135 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 04276135 |  |  |  |  |
|  |  |  |  |  |
| 054 | 76 | 1 | 3 | 5 |
| 0427 | 16 | 35 |  |  |
| 024711356 |  |  |  |  |
| 01234567 |  |  |  |  |

(d) Use heapsort to sort the following array (hint: draw out the heap). Draw out the array at each step:

$$
0,6,2,7,4
$$

76204 (turns the array into a valid heap)
64207 ('delete' 7, then sink 4)
40267 ('delete' 6, then sink 0)
20467 ('delete' 4, then sink 2)
02467 ('delete' 2)
02467 ('delete' 0)
